BACKGROUND OF THE INVENTION

Disposable diapers have proven to be a valuable asset to infant care. It is a fact, however, that there are more products needed other than diapers during the diaper changing process. These such materials may include, but are not limited to, baby wipes, baby powder, or even diaper rash ointment. With more insight into the invention, it was further discovered that this product, could dramatically decrease the bulk of a baby's bag. The practicality of this product is evident with the addition of the other needed products. This concept includes the use of baby wipes, baby powder, and even optional medical products such as diaper rash ointment.

BRIEF SUMMARY OF THE INVENTION

The object of this invention is to make the changing of diapers an easier process. The invention is a physical addition of a package of five wipes, by a small plastic pocket to the front of the diaper, as well as a pocket containing baby powder. The pocket containing the wipes, powder, and optional ointment would be enclosed in such a manner so the wipes would not dry out, and the other materials wouldn't be exposed to the wipes. This product solves the problem of having to pack both diapers and wipes, or even ointment, which are all space consuming products.

BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING

FIG. 1 is a bottom plan view, shown sideways, of the diaper.

FIG. 2 is an enlarged view of the affixed package.

FIG. 3 is a side view taken of the closed diaper.

FIG. 4 is a side view of an opened diaper.

FIG. 5 is a top plan view, shown sideways, of the diaper.

DETAILED DESCRIPTION OF THE INVENTION

If manufactured, this product would be produced similarly to that of conventional diapers, including all of the modern features. The features included would be a gathered waistband, leg gathers, stay-dry liners, highly absorbant materials, adhesive tabs, and even the decorative outer linings of the diaper. A plastic packet containing five wipes would be secured to the front of the diaper. This pocket, would have a zipper-style closure that would ensure that the wipes didn't dry out. The pocket containg baby powder would be attached in the same manner. During the changing process, when wipes are needed, the care procider would open the pocket, remove the contents, and use as needed. The package would be attached to the diaper in such a manner that would allow it to be easily removed when needed. The contents of would be separated in the package so that none of them wold be exposed to the other.

This invention is appealing because all of the materials needed to change a diaper would be easily accessible, and it wouldn't be necessary to add diapers, a box of wipes, a bottle of baby powder, and even a tube of ointment to the bag, rather all of these materials will be at the care provider's disposal.

DETAILED DESCRIPTION OF SEVERAL VIEWS OF THE DRAWINGS

As shown in **FIG. 1**, the affixed pouch is bundled to the top portion of the bottom side of the diaper **3**. **FIG. 2** is an enlarged view of the detachable pouch **4**. This pouch encloses the materials used when changing a diaper. The left and larger side of the pouch **6**, is the hermetically sealed portion enclosing the baby wipes. **5** keeps the materials in **6** from having any contact with the materials located in **8** and **9**. The larger, right hand side of the pouch **8**, is where the baby powder contents will be located. **10** is a seal that allows or easy opening of all of the contents. **FIG. 3** is a side view showing both the top **2**, and bottom **3**, with their relative location and proportionality to that of the affixed pouch **4**. This view also allows for an idea of the amount of space the pouch **4** takes up in regards to the remainder of the diaper. **FIG. 4** further shows the pouch **4**, in relation to the rest of the diaper. **FIG. 5** shows that the top of the diaper, which is not affected by the affixed pouch **4**.
